

Loading Robot

Excellence in raw product preparation

The loading of the product is the first link in your machine chain, and even at this early stage precision and intelligent solutions are called for. Schiwa Loading Robots detect, feed in, position and divide both cured ham and bacon products and blocks and bars of cheese. They are then fed automatically into the slicing line.

There are also benefits at this stage from the ALL-IN-ONE principle, as the entire line is controlled from the Schiwa PC on one central screen.

Loading robots from Schiwa stand out from the rest as they deliver the ultimate in precision and reliability as well as outstanding quality.

Operations:

- Cured ham loaf: detects, collects, turns through 90° and places in position
- Block of cheese: intelligent horizontal division
- Bars of cheese: detects, collects, turns through 90° and places in position
